

# Creating a White Panel for Metallic Digi-Foil Work

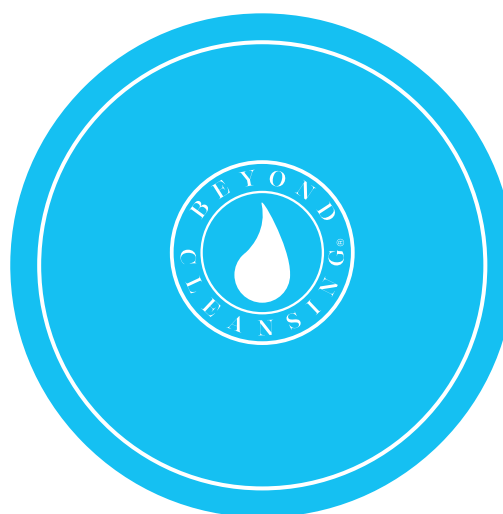

In order to produce a Metallic Digi-Foil label (please see our website) the art file will need to include a white panel or layer. Please keep in mind we are printing the image on a bright metallic silver material. The inks we use are transparent so when printed on the bright metallic silver material the inks will also have a metallic appearance. Any area that should not be metallic needs to have a white panel included. Those areas in the image that have white behind them will be opaque. The white layer should be indicated as a solid light blue or another color.

Please see the example below.

CMYK

White Plate

**ORANGE  
COUNTY  
LABEL**
